
图 4-1　正态分布与标准化的关系

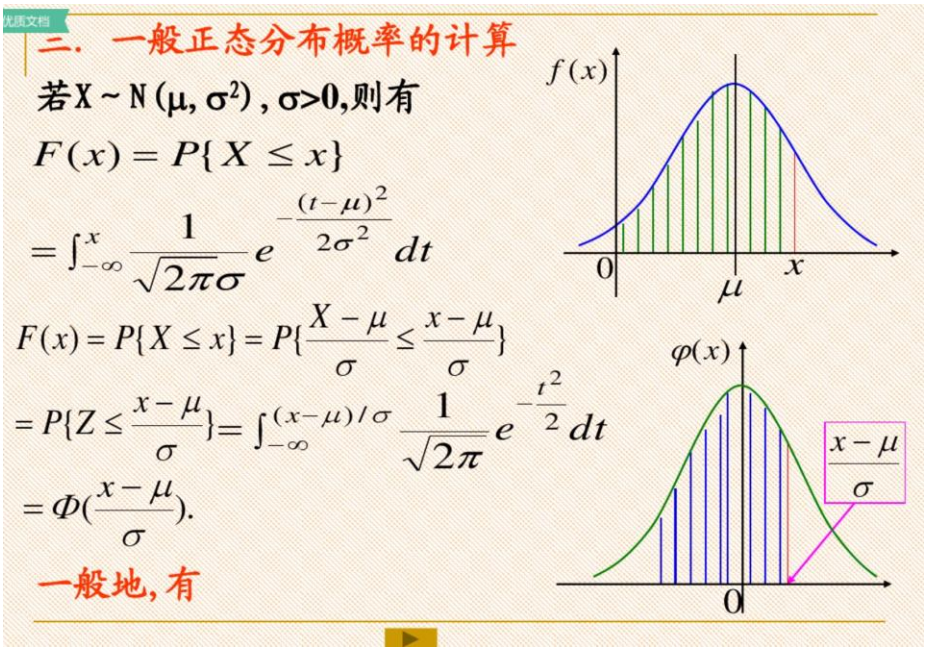
参考离差智商：

(2)离差智商（deviation IQ）

- 用统计学的标准分概念来计算智商，表示被试者的成绩偏离同年龄组平均成绩的距离(以标准差为单位)。
- 公式：

$$IQ = 100 + 15\left(\frac{X - \overline{X}}{SD}\right)$$

（韦克斯勒的离差智商）



给出

X~N（$X_{总体}$，$SD_{总体}^2$）

被试在某一维度得分标准分$X_{标准}$=该维度平均分+标准差*（某被试该维度得分-被试所在年级在该维度的平均分）\被试所在年级在该维度的标准差

$$X_{标准} = \bar{X}_{总体} + SD_{总体} \times (\frac{X_{测} - \bar{X}_{分组}}{SD_{分组}})$$

被试在某一维度得分标准分对应于正态分布图中的横坐标。

$$超过同年级百分比 = \mathrm{P} \times 100\% = \phi(\frac{X_{标准} - \bar{X}_{总体}}{SD_{总体}}) \times 100\%$$

附录：标准正态分布表

$$\Phi(z)=\int_{-\infty}^{z}\frac{1}{\sqrt{2\pi}}e^{-\frac{u^2}{2}}du=P\{Z\leqslant z\}$$
